MULTILINGUAL MEETINGS / BUILT WITH GNANI AI

Charcha

Meet in your language. Move forward together.

Interpretation, visible corrections and a bilingual record.

FOR TEAMS WITH MORE THAN ONE LANGUAGE

Teams, students and community organisers share goals across languages. When a room, time or number changes, everyone needs the latest instruction.

01

Hear your language

Join a host-controlled browser meeting with interpreted speech, consented personal voices, and original plus translated captions.

02

Make updates visible

An edit creates a new version. Each listener can acknowledge the update; earlier acknowledgements stay with the earlier version.

03

Keep a shared record

A bilingual recap preserves original and corrected turns, with export for review after the meeting.

DEMO MOMENT

Room 3 → **Room 4**

New version

Fresh acknowledgement from each listener

SPEAK

Gnani speech + voice cloning

LiveKit carries media. React/TypeScript and FastAPI manage versioned turns, listener acknowledgements and ordered playback. Keycloak supports sign-in; Modal starts and scales inference around meetings. GCP hosts the app.

ENGINEERING EVIDENCE / 9 NOVEMBER 2026

1,468
backend tests passed*

322
frontend tests passed

7
runtime checks passed

3.94 s / 4.23 s - two recorded translation-start to first decoded audio cases. Excludes speech recognition, meeting transport and listener playback.

*One backend test skipped. Production build passed.

NEXT: FLUENT-LISTENER ACCEPTANCE AND FULL LISTENER-LATENCY TESTING

Ten languages are configurable; quality coverage is narrower. VoiceShield is experimental, with no established detection accuracy. The full inference chain is not verified India-only.

Edited demo: synthetic test speech, saved provider output, illustrated personas and labelled UI replay. Development and presentation used AI assistance.
