MEET IN YOUR LANGUAGE. LEAVE WITH SHARED UNDERSTANDING.

Charcha

Multilingual meetings with a shared record

Interpretation, visible corrections and listener acknowledgement in one meeting.

THE PROBLEM

Teams, students and community organisers can share a goal without sharing a fluent language. A changed time, count or room number can leave people following different instructions.

THE EXPERIENCE

Join a host-controlled browser meeting, select a language and hear interpreted speech using consented personal voices. Original and translated captions stay visible. Corrections preserve earlier versions and require new listener acknowledgements. A bilingual recap supports PDF, WhatsApp, text and JSON export.

HOW IT WORKS

LiveKit media + Gnani Prisma recognition + hosted Evon v3.3 translation + Gnani speech and voice cloning. React/TypeScript and Python/FastAPI coordinate translation and synthesis shared by target language, ordered playback and bounded preparation concurrency. Admission, separate administrator MFA, seat credential renewal on reconnect, account-scoped performance reports and meeting-driven Modal GPU startup/scaledown support operations. GCP hosts the app; the entire inference chain is not verified India-only.

CURRENT EVIDENCE

1,468 backend tests passed (one skipped) | **322 frontend tests** | **7 runtime checks**
Production build passed. Historical real-provider runs delivered audio on 9 of 10 attempted routes across five languages; meaning review is pending.

3.94 s / 4.23 s in recorded demo cases, from translation start to first decoded audio. These partial server measurements exclude recognition, meeting transport and listener playback.

SCOPE AND NEXT VALIDATION

Ten languages are configurable; this is not ten-language quality certification. **VoiceShield is experimental, with no validated detection accuracy.** Next: fluent-listener acceptance, multi-device reliability and complete listener-latency measurement.

Demo disclosure: synthetic test speech, saved provider output, illustrative characters and labelled UI replay. Development and presentation used AI assistance and established open-source components.
