Different languages. One shared plan.

Interpreted speech, visible corrections and a bilingual record for teams, students and community organisers.

ONE SMALL CORRECTION. EVERYONE IN SYNC.

Asha speaks Hindi. Ravi listens in Telugu. Meher in Punjabi.
Tomorrow's workshop moves from Room 3 to Room 4. Charcha creates a new version; Ravi and Meher each acknowledge the update. The bilingual recap keeps the original turn, correction and confirmations together.

Built for shared understanding

Hear your language. Interpreted speech and dual captions in a host-controlled browser meeting.

Correct together. Edits create new versions. Each listener acknowledges the update; earlier acknowledgements stay with the earlier message.

Keep the context. Export the bilingual version history. Acknowledgements record understanding, not legal agreement.

Gnani at the core

Prisma STT > Evon v3.3 MT > Timbre TTS

LiveKit media, shared target-language branches, bounded queues and ordered playback. React/TypeScript, FastAPI and Keycloak provide the application and access controls.

Meeting-driven Modal inference; saved stage and receiver measurements with missing data kept explicit.

Consented voice cloning; experimental VoiceShield source-audio screening without an established detection-accuracy claim.

Evidence, with clear boundaries

3.94 s / 4.23 s
Two saved cases, 9 Nov 2026: translation start to first decoded synthesis audio. Excludes STT, meeting transport and physical listener playback.

Local checks / 9 Nov 2026
1,468 backend tests passed (1 skipped); 322 frontend tests and 7 runtime checks passed. Build passed.

2m40 build film
Actual screens from a scripted three-account rehearsal, with prepared standard-voice readings; not a simultaneous live interpreted call. Fictional personas; AI-assisted development and presentation.

Next proof to earn

Ten configurable languages; quality coverage is narrower. Next: fluent-listener acceptance and physical end-to-end latency. The full inference chain is not verified India-only.

A Telugu speaker's perspective

The platform provides a really useful way to communicate with people who speak different languages through both text and voice translation. I liked how it makes conversations more accessible and helps people understand each other better. The experience was engaging and easy to follow, although there is some scope to improve response latency. Overall, it's a useful platform that can help people connect without language barriers.
